

## Telecommunications – Integrated Security Management Solutions

### Overview

Working alongside global Telecommunications and IT service providers, GSS Guide Security Services Ltd (GSS) have developed an Integrated IP Security and Access management solution for their global communications infrastructure. The solution incorporates leading edge technologies and proven compliance management software, providing an end to end solution for the protection of Buildings, Network and Data Centre facilities.

The following brief provides a high level overview of the components and processes which have been implemented on an international scale, in the protection of corporate networks for the communications and IT industry.

This communication also includes details of our high value asset protection solution, ConServe™ the GSS designed and manufactured, rack mounted data centre security solution; provides enhanced I.T. rack security and management within data centre environments suffering from high level organised crime and equipment theft.

### Building Security

Building security and access control is managed via integrated IP solutions, complimenting physical and structural hardening.

Buildings are provided with layered security protection including internal and external CCTV, utilising video content analysis, for effective detection and identification. Centralised video data management solutions and video retrieval enables a complete picture to be formed, communicated and appropriate action implemented globally.

Remotely managed intruder detection and access control allows effective management of personnel and immediate event driven response during a security breach.

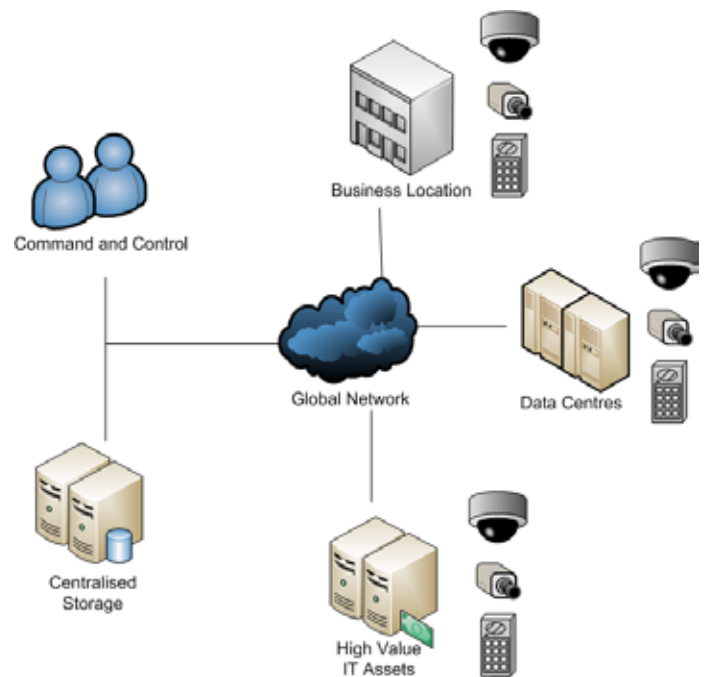

### Data Centre Protection

Business critical locations have increased levels of security commensurate with the associated risk. Enhanced physical security on door entry points are complimented by identity management equipment and processes.

Electronic access control and intruder detection utilises 'real time' communication with the security control centre allowing personnel identification and access management.

### High Value Asset Protection

Specific equipment locations are afforded maximum protection with integrated physical security enclosures and access control via multimodal biometric recognition, two way audio and covert object surveillance. Full audio challenge and facial recognition once again allows real time remote management of equipment access.

### Security Control Room Management

Legacy system integration and alarm event driven compliance, provides a reliable convergence platform for a truly global security environment.

High value asset protection and high security system segregation allows maximum network protection at multiple locations.
